

## ***Abstract***

*Adolescence's was a change phase from childhood to adulthood. Interpersonal communication for adolescence's become important, because by doing effective interpersonal communication with their family, the development of their self confidence will increase. With good self confidence adolescent's will have good problem solving skill and adapted better in their social environment. This research was conducted to find the correlation of adolescence's perception towards interpersonal communication in family and adolescence's self confidence. This research use quantitative methodes, with correlational design. Questionnaire was used to collect research data. The subject of this research are 253 adolescent's in highschool with age range 15-18 years old. Cronbach's alpha for interpersonal communication measurement scale is 0,933 and 0,886 for self confidence. This research found there is a positive correlation with high significant level between adolescence's perception towards interpersonal communication and adolescence's self confidence, value of correlation  $(r) = 0.414$ ,  $(p) 0.000 < 0.01$ . Which means if the level of interpersonal communication is high then the level of self confidence is also high.(LFR)*
